## MATH170U35 Probability Question 11

In the chart in column two, record the theoretical probability as a decimal for each sum (found in problem #8). Find two dice. Roll the dice 50 times. Keep a tally of the results in column three of the chart. For each of the sums, write the tally as a number in column four. Based on 50 tosses, write the actual outcome for each sum as a fraction in column five, and then write the actual outcome for each sum as a decimal in the last column. In the answer box below write the sum, theoretical decimal probability, actual number of occurrences for each sum, actual outcomes as a fraction, and the actual outcomes as a decimal. For example: If the sum of three was actually rolled 6 times out of 50, in the answer box you would write: Three, 0.06, 6, 6/50, and 0.12.

| POSSIBLE<br>SUMS | THEORETICAL<br>OUTCOME AS<br>A DECIMAL | ACTUAL<br>TALLY | NUMBER OF<br>OCCURRENCES | ACTUAL OUTCOME AS A FRACTION (50 TRIALS) | ACTUAL OUTCOME AS A DECIMAL (50 TRIALS) |
|------------------|--|-----------------|--------------------------|--|---|
| TWO              |  |                 |                          |  |   |
| THREE            |  |                 |                          |  |   |
| FOUR             |  |                 |                          |  |   |
| FIVE             |  |                 |                          |  |   |
| SIX              |  |                 |                          |  |   |
| SEVEN            |  |                 |                          |  |   |
| EIGHT            |  |                 |                          |  |   |
| NINE             |  |                 |                          |  |   |
| TEN              |  |                 |                          |  |   |
| ELEVEN           |  |                 |                          |  |   |
| TWELVE           |  |                 |                          |  |   |
| TOTAL            |  |                 |                          |  |   |
